

Task 1: Simple Responsive Landing Page Using HTML & CSS

Objective :

I will create a simple responsive landing page using HTML and CSS.

Tools :

- VS Code
- Live Server
- GitHub

Concepts :

- HTML
- CSS
- Grid
- Responsive Design

Interview Questions :

1. What is Semantic HTML?

Semantic HTML means using HTML tags that clearly tell what the content is about. For example, <header>, <nav>, <section>, and <footer>

2. How does CSS Flexbox differ from Grid?

Flexbox is mainly used for arranging items in a row or column. Grid is used for arranging items in both rows and columns.

3. What are Media Queries?

Media queries are used to apply different CSS styles for different screen sizes, like mobile, tablet, and desktop.

4. How do you make a website responsive?

I can make a website responsive by using Flexbox or Grid, flexible sizes, and media queries so the website works on different screen sizes.

5. Explain the Box Model?

The CSS box model consists of four parts: content, padding, border, and margin.

6. What is the difference between Classes and IDs in CSS?

A class can be used for multiple elements, while an ID is normally used for one specific element.

Example:

```
.text {  
  color: blue; }  
  
{  
  color: red;  
}
```

7. How can you optimize CSS for performance?

I can optimize CSS by removing unused CSS, avoiding unnecessary code, and keeping the CSS file simple and small.

8. What is the difference between Relative and Absolute positioning?

Relative positioning moves an element from its normal position. Absolute positioning places an element based on its nearest positioned parent.

9. How does the z-index property work?

z-index controls which element appears on top when elements overlap. A higher z-index usually appears above a lower one.

10. What is the difference between Padding and Margin?

Padding is the space inside an element, between the content and border. Margin is the space outside the element.

Conclusion :

By completing this task, I learned the basics of HTML and CSS. I understood how to create a simple webpage, use Flexbox, add media queries, and make the page responsive. I also learned basic CSS concepts like the box model, padding, margin, positioning, and z-index.
